                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                      Score

HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by
The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kbm glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                         The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                      Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Colman WR,

                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a fragment of the light chain of huma high molecular weight kininogen. It is used to produce compounds of the invention. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 3; Page 36; 41pp; English.

High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting anglogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                    high molecular weight; kininogen; fragment; 1.2; wound treating agent; bovine; growth promotion;
                                                                                                               28-MAR-1995

The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim

The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to
                                                                                                                                                      AAR75181 is a partial peptide corresponding to human kininogen fragment 1.2, amino acids 390-520. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compsns, and act as the active component. The fragments are

                                                                                                                                                                                                                                                                                                                                                                            AAR75179 is a partial peptide corresponding to bovine kininogen fragment 2, amino acids 456-496. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent componens and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

Best Local
Cell adhesion inhibiting peptide(s), used as cancer metastasis inhibitor – comprises partial amino acid sequence of human high polymer quininogen {\bf L} chain
                                               WPI; 1996-421988/42
                                                                                                                                                                                                                                                                                          Human; high polymer; quininogen; L-chain; cell adhesion; cancer metastasis; platelet aggregation; inhibition; wound; inflammatory disease; arteriosclerosis; glomerular nephritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR75178 is a partial peptide corresponding to bovine kininogen fragment 1.2, amino acids 387-496. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compones. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

           The patent discloses a method for preventing or treating a disorder resulting from the release of bradykinin in a mammal which produces a heparin-binding protein (HBP) that binds to a HBP antagonist This method involves administration of a mammalian HBP antagonist (especially aprottinin) and/or monoclonal antibodies that bind to prekallikrein-H-kininogen complexes in the HBP, to decrease the release of bradykinin in the mammal. The antagonists of HBP (e.g. aprottinin) decrease the permeability of the endothelial cells and are used to prevent or treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; heparin binding protein; HBP; antiinflammatory; cardiovascular; immunosuppressive; vasotropic; prevention; treatment; bradykinin; aprotinin; H-kininoqen; HK; systemic inflammatory response syndrome; pre-kallikrein; ischaemia reperfusion; anaphylaxis; allograft rejection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     are useful in cell adhesion, cancer metastasis or platelet aggregation inhibitors, and in wound, inflammatory disease, arteriosclerosis or glomerular nephritis treating agents. The present peptide was synthesised using a solid phase method, and purified using a YMC-DOS-120A-S15/13 column.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim

            or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting anglogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis methods.
                                                                                                                                                                             The present sequence is derived from human two-chain high molecular weight kininogen (HKa) domain 5. HKa is product of high molecular weight kininogen (HK) cleavage by plasma kallikrein. HK is a 120 key glycoprotein which binds with high affinity to endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    respiratory distress syndrome. The present sequence is HKH20 peptide which is derived from the domain 5 of human H-Kininogen (HK) protein (479-498 residues). HKH20 treatment of endothelial cells inhibits or prevents the HBP-induced increase in permeability of the endothelial cells.
                                                                                                                                                                                                                                                                Claim
                                                                                                                                                                                                                                                                                                               A pharmaceutical composition used to inhibit angiogenesis, inhibit endothelial cell proliferation, and induce endothelial cell apoptosis
